

Git Strategy - Assignment 4

The project is managed in a private Git repository. Work is separated into feature branches and merged into `main` using Pull Requests.

Branch Plan

- `feature/mvc-structure` - organize server code into models, controllers, routes, views, and config.
- `feature/mongodb` - add MongoDB connection and Mongoose post model.
- `feature/delete-post` - add the server-side delete route and controller logic.
- `feature/client-fetch` - delete posts from the browser with `fetch` without refreshing the page.
- `feature/readme` - document setup, MVC structure, routes, and Git rules.

Pull Request Process

- Each feature branch is committed separately.
- A Pull Request is opened from the feature branch into `main`.
- The second partner reviews and approves the Pull Request.
- Only approved Pull Requests are merged into `main`.

Security Rules

- `.env` is not committed.
- `node_modules/` is not committed.
- Passwords, tokens, API keys, and personal secrets are not committed.
- The repository remains private.

Testing Before Merge

- Start the server with `npm start`.
- Confirm MongoDB connects successfully.
- Confirm posts load from MongoDB.
- Create a post and confirm it appears in the feed.
- Delete a post and confirm it disappears from the page and MongoDB.
- Refresh the page and confirm the deleted post does not return.
- Try deleting a missing post and confirm the server returns `Post not found`.
